Model 40/40I
Triple IR (IR3) Flame Detector
User Guide
**Legal Notice**

The SPECTREX SharpEye Optical Flame Detector described in this document is the property of Rosemount.

No part of the hardware, software or documentation may be reproduced, transmitted, transcribed, stored in a retrieval system or translated into any language or computer language, in any form or by any means, without prior written permission of Rosemount.

While great efforts have been made to assure the accuracy and clarity of this document, Rosemount assumes no liability resulting from any omissions in this document, or from misuse of the information obtained herein. The information in this document has been carefully checked and is believed to be entirely reliable with all of the necessary information included. Rosemount reserves the right to make changes to any products described herein to improve reliability, function, or design, and reserves the right to revise this document and make changes from time to time in content hereof with no obligation to notify any persons of revisions or changes. Rosemount does not assume any liability arising out of the application or any use of any product or circuit described herein; neither does it convey license under its patent rights or the rights of others.

**Warranty**

SPECTREX agrees to extend to Purchaser/Distributor a warranty on the SPECTREX supplied components of the SharpEye products. SPECTREX warrants to Purchaser/Distributor that the products are free from defects in materials and workmanship for a period of five (5) years, commencing with the date of delivery to Purchaser/Distributor. SPECTREX expressly excludes damage incurred in transit from the factory or other damage due to abuse, misuse, improper installation, or lack of maintenance or "Act of God" which are above and beyond its control. SPECTREX will, upon receipt of any defective product, transportation prepaid, repair or replace it at its sole discretion if found to have been defective when shipped. Said repair or replacement is SPECTREX’S sole liability under this warranty and SPECTREX’S liability shall be limited to repair or replacement of the component found defective and shall not include any liability for consequential or other damages. The customer is responsible for all freight charges and taxes due on shipments both ways. This warranty is exclusive of all other warranties express or implied.

1 About this Guide

This guide describes the SharpEye Model 40/40I Triple IR (IR3) Flame Detector and its features and provides instructions on how to install, operate, and maintain the detector.

Note: This user guide should be read carefully by all individuals who have or will have responsibility for using, maintaining, or servicing the product.

This guide includes the following chapters and appendices:

- **Chapter 1, About this Guide**, details the layout of the guide, includes the release history, a glossary and abbreviations, and explains how notifications are used in the guide.
- **Chapter 2, Product Overview**, provides a general overview of the product, principles of operation, and performance considerations.
- **Chapter 3, Installing the Detector**, describes how to install the detector including preparations before installation, wiring and mode settings.
- **Chapter 4, Operating the Detector**, describes how to power-up and test the detector. The chapter also lists safety precautions you should take when operating the detector.
- **Chapter 5, Maintenance and Troubleshooting**, describes basic maintenance, troubleshooting, and support procedures.
- **Appendix A, Specifications**, lists the detectors’ technical and other specifications.
- **Appendix B, Wiring Instructions**, lists the wiring instructions for connecting the detector and also provides examples of typical wiring configurations.
- **Appendix C, RS-485 Communication Network**, provides an overview of the RS-485 communications network.
- **Appendix D, Accessories**, describes the accessories available for the detector.
- **Appendix E, SIL-2 Features**, describes the special conditions for compliance with EN 61508 for SIL 2 requirements according to TÜV.
- **Appendix F, End of Line Resistor**, describes the option of adding an end of line resistor.

1.3 **Notifications**

This section explains and exemplifies the usage of warnings, cautions, and notes throughout this guide:

---

**Warning:**

This indicates a potentially hazardous situation that could result in serious injury and/or major damage to the equipment.

---

**Caution:**

This indicates a situation that could result in minor injury and/or damage to the equipment.

---

**Note:**

This provides supplementary information, emphasizes a point or procedure, or gives a tip to facilitate operation.
2 Product Overview

The SharpEye 40/40I is a flame detector that utilizes improved IR3 technology to provide state-of-the-art fire protection. The 40/40I uses patented digital signal processing to analyze the spectral and dynamic characteristics of the measured infrared radiation, to identify fire events with exceptional sensitivity and extreme immunity to false alarms.

All 40/40 series detectors include a heated optical window for improved performance in ice, snow, and condensation conditions.

Detection performance can be easily adapted to all environments, applications, and requirements, by changing the detector’s configuration parameters. Adjusting these parameters, as well as performing other maintenance and monitoring tasks, is possible by means of RS-485-based Modbus communication or HART communication (in models with 0–20mA output).

**Warning:**

The detector is not field-repairable due to the meticulous alignment and calibration of the sensors and the respective circuits. Do not attempt to modify or repair the internal circuits or change their settings, as this will impair the system’s performance and void the SPECTREX product warranty.

The SharpEye 40/40 detector is designed to operate as a stand-alone unit directly connected to an alarm system or an automatic fire extinguishing system. The detector can also be a part of a more complex system, where many detectors and other devices are integrated through a common control unit.

2.1 Approvals

The detector enclosure is ATEX certified Exd flameproof with an integral, segregated, rear, Exe terminal compartment (avoiding exposure of the sensors and electronics to the surrounding environment). Hence the combined approval:

- Ex II 2G D
- Ex db eb op is IIC T4 Gb
- Ex tb op is IIIC T96°C Db
- (−55°C ≤ Ta ≤ +75°C)
- Or
- Ex II 2G D
- Ex db eb op is IIC T4 Gb
- Ex tb op is IIIC T106°C Db
- (−55°C ≤ Ta ≤ +85°C)
2.2 Model and Types

The 40/40I Flame Detector is provided in various configurations depending on:

- Wiring options
- Temperature ranges
- Type of cable entries
- Housing material type
- Required approval

The configuration detail is included in the product part number on the product label and takes the form: 40/40I-XXXXX, where XXXXX defines the model according to the above requirements.

To modify the default or pre-ordered configuration and perform maintenance tasks, please refer to the HART Protocol TM77030, the RS-485 Manual TM77050 or TM77070.

The P/Ns are defined as:

```
40/40I X X X X X
```

- **Ex—Approval**
  - B—inmetro
  - F—FM/CSA
  - C—ATEx/IECEx
  - R—TR—CU

- **Housing**
  - S—Stainless Steel
  - A—Aluminum

- **Electrical Entries**
  - 1—M25
  - 2—3/4” NPT

- **Temperature**
  - 1—75°C
  - 2—85°C

- **Wiring Configuration**

See Table 1

---

**Note:**

Aluminum housing is not available in the FM version.
Table 1 describes the wiring options in detail.

**Table 1: Wiring Options**

<table>
<thead>
<tr>
<th>Wiring Option</th>
<th>Connections Provided</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Power Manual BIT Fault Relay N.C. Alarm Relay N.O. 0–20mA Sink RS-485 HART</td>
</tr>
<tr>
<td>4</td>
<td>Power Manual BIT Fault Relay N.C. Alarm Relay N.O. Auxiliary N.O. RS-485 -</td>
</tr>
<tr>
<td>5</td>
<td>Power Manual BIT Fault Relay N.O. Alarm Relay N.O. Auxiliary N.O. RS-485 -</td>
</tr>
</tbody>
</table>

**Note:**
Wiring option 1 is the default. The mA sink output can be altered to source type, with a link between Terminals 1 and 8. No other wiring options can be changed onsite.

For example, product number 40/40I-321SC has the following options:

- **Wiring Option:** 3 (Power, manual BIT, RS-485, 0–20mA [Source] with the HART protocol, Fault Relay [N.O.], Alarm Relay [N.O., N.C.])
- **Temperature Range:** 2 (85°C)
- **Cable Entry:** 1 (M25)
- **Housing:** S (Stainless steel)
- **Approval:** C (ATEX, IECEx)

**Note:**
Check your specific part numbers against the information in *Checking the Product Type* on page 34
2.3 Features and Benefits

- Detection Range: Up to 215ft/65m for a 1ft\(^2/0.1m^2\) n-heptane fire.
- Ultra-High Immunity to False Alarms: See Table 4 on page 24.
- Multi IR Channels: Between 2–5µm.
- Field Programmable Sensitivity: 4 ranges to avoid zone crossover.
- Built-In-Test (BIT): Manual and Automatic (see Built-In-Test (BIT) on page 29).
- Heated Window: Prevents effects of ice, snow, and condensation.
- Electrical Interface:
  - Dry contact relays
  - Communication network RS-485
  - 0–20mA output
- Exde: Integral junction box for easy wiring.
- SIL-2: TÜV approved.
- Hazardous Area Certification: ATEX, IECEx, FM, CSA.
- Functionality Approval:
  - EN54-10 approved by VdS
  - FM approved per FM3260
  - Accessories are approved as part of ATEX and IECEx approval.

2.4 Principles of Operation

This section describes the 40/40I principles of operation.

2.4.1 Hydrocarbon Fire Detection

The SharpEye 40/40I Detector is designed to detect flames in which carbon dioxide (CO\(_2\)) is produced in the combustion process. These include all hydrocarbon flames, as well as other types of flames and burning materials such as wood or alcohol.

The detector’s principle of operation is based on patented IR3 technology. This technology identifies the unique spectral signature that hot CO\(_2\) has in the infrared (IR), namely a peak of intensity at wavelengths of 4.2–4.7µm.

The original IR3 technique (such as implemented in the SharpEye 20/20I Flame Detector) utilizes 3 infrared sensors, each sensitive to its own wavelength range. The first sensor is sensitive to wavelengths within the emission peak of hot CO\(_2\). The other 2 sensors are sensitive to wavelengths above and below this peak. In the event of fire, the signal measured in the first sensor is significantly higher.
than those measured in the other 2 sensors. In order to trigger a fire alarm, these and other conditions must be met (for example, radiation is flickering in frequencies typical of flames). The detector does not react when exposed to non-fire radiation sources.

The SharpEye 40/40I also includes an additional IR sensor, sensitive to a different band within the emission peak of hot CO₂. This sensor’s signal is compared to those of the other 3, thereby increasing sensitivity for some types of flames, such as gas flames.

2.4.2 Heated Optics

The SharpEye 40/40 Flame Detector uses heated optics. The heater increases the temperature of the optical surface by 5–8°F / ~3–5°C above the ambient temperature to improve performance in ice, condensation, and snow conditions.

The heated optics can be set to one of the following:

- Not operated.
- On continuously.
- Automatic, per temperature change (default): you can define the start temperature below which the window is heated. (The default is 41°F/5°C.) This temperature can be defined from 32°F/0°C to 86°F/30°C. The heating stops when the temperature is 27°F/15°C above the start temperature.

For more information, see Configuring Your Detector on page 43.

2.4.3 HART Protocol

The 40/40 Flame Detectors use the HART protocol.

HART Communication is a bi-directional industrial field communication protocol used to communicate between intelligent field instruments and host systems. HART is the global standard for smart process instrumentation and the majority of smart field devices installed in plants worldwide are HART-enabled. HART is available in wiring options 1, 2, and 3, see Table 1, page 17.

HART technology is easy to use and very reliable.

Through the HART connection, you are able to perform:

- Detector setup
- Detector troubleshooting
- Detector health and status

For more details, refer to the HART Manual TM777030.

2.4.4 RS-485 Modbus

For more advanced communications, the 40/40I detector has an RS-485 Modbus-compatible output that provides data communication from a network (up to 247 detectors) to a host computer or universal controller for central monitoring. This feature allows for reduced installation costs, easy maintenance, and local or remote diagnostic tools.
2.4.5 Product Certification

The 40/40I Flame Detectors have the following certifications:

- ATEX, IECEx, page 20
- FM, CSA, page 20
- SIL-2, page 21
- EN54-10, page 21
- Inmetro (UL), page 21
- TR CU/EAC, page 21

2.4.5.1 ATEX, IECEx

The 40/40I Flame Detector is certified to:

ATEX per SIRA 07ATEX1250X and IECEx per IECEx SIR 07.0085X
Ex II 2G D
Ex db eb op is IIC T4 Gb
Ex tb op is IIIC T96°C Db
(-55°C ≤ Ta ≤ +75°C)
Or

Ex db eb op is IIC T4 Gb
Ex tb op is IIIC T106°C Db
(-55°C ≤ Ta ≤ +85°C)

The accessories, Tilt Mount P/N 40/40-001, Weather Cover P/N 777163 and P/N 777268, Duct Mount P/N 777670, and Air Shield P/N 777650 are included in the approval.

This product is suitable for use in hazardous Zones 1 and 2 with IIC gas group vapors present, and Zones 21 and 22 with IIIC dust type present.

2.4.5.2 FM, CSA

The 40/40I Flame Detector is approved per FM and CSA Explosion Proof and Functionality per FM3260:

- Class I, Division 1, Groups B, C and D.
- Dust Ignition Proof – Class II/III Division 1, Groups E, F and G.
- Ingress Protection – IP67, IP66, NEMA 250 Type 6P.
- For more details see FM Report Project ID3029553, and CSA Report No. 2451134.
2.4.5.3 **SIL-2**

The 40/40I Flame Detector is approved per SIL-2 requirement per IEC 61508.4, Chapter 3.5.12.

The alert condition according to SIL-2 can be implemented by:

- Alert signal via 0–20mA current loop
- Alert signal via alarm relay and fault relay
- For more details and guidelines for configuring, installing, operating, and service, see *SIL-2 Features* on page 81 and *TÜV Report No. 968/EZ 348*.

2.4.5.4 **EN54-10**

The 40/40I Flame Detector is approved per EN54-10 and CPD.

- The detector is listed as Class 1 for sensitivity settings 15, 30, 45 and 60.
- The detector is approved per EN54-10 by VdS.
- This test includes a functional test, environmental test, EMI/EMC test, and software check.
- For more details see VdS Report No. BMA 150190-AU01+BZA02-PB01.

2.4.5.5 **Inmetro (UL)**

The 40/40I Flame Detector is in compliance with the standards ABNT NBR IEC 60079-0, ABNT NBR IEC 60079-1, ABNT NBR IEC 60079-7, ABNT NBR IEC 60079-18, ABNT NBR IEC 60079-31, and INMETRO decree No. 179 as of May 18th, 2010. Further details may be found on Certificate of Compliance No. UL-BR 16.065XX.

2.4.5.6 **TR CU/EAC**

The 40/40I Flame Detector is in compliance with the standard TR CU 012/2011 per:

1. **Ex db eb op is IIC T4 Gb X**
   
   Ex tb op is IIIC T96°C Db X
   
   ($-55°C \leq T_a \leq +75°C$)
   
   Or

2. **Ex db eb op is IIC T4 Gb X**
   
   Ex tb op is IIIC T106°C Db X
   
   ($-55°C \leq T_a \leq +85°C$)
   
   Or

3. **Ex db eb mb op is IIC T4 Gb X**
   
   Ex tb op is IIIC T98°C Db X
   
   ($-55°C \leq T_a \leq +75°C$)
   
   For more details, see TR CU certificate No. TC RU C- US.MIO62.B.05536.
2.5 Performance Considerations

This section describes performance aspects of the 40/40I.

2.5.1 Detection Sensitivity

Detection sensitivity is the maximum distance at which the detector reliably detects a specific size of fire and typical type of fuel (standard fire).

2.5.1.1 Standard Fire

Defined as a 1ft²/0.1m² n-heptane pan fire, with maximum wind speed of 6.5ft/sec / 2m/sec.

2.5.1.2 Sensitivity Ranges

The detector has 4 user-selectable sensitivity ranges. For each range there are 2 response levels:

- Warning (Pre-alarm)
- Alarm

The detection distance for the warning level is approximately 10% higher than for the alarm distance.

Alarm response times for a standard fire at a specified range are shown Table 2.

<table>
<thead>
<tr>
<th>Level</th>
<th>Response Time (sec)</th>
<th>Sensitivity Range (ft/m)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>3</td>
<td>50/15</td>
</tr>
<tr>
<td>2 (default)</td>
<td>5</td>
<td>100/30</td>
</tr>
<tr>
<td>3</td>
<td>8</td>
<td>150/45</td>
</tr>
<tr>
<td>4</td>
<td>10</td>
<td>215/65</td>
</tr>
</tbody>
</table>

For some typical ambient conditions the Zeta parameter as defined in NFPA 72 for the detector is 0.005 (1/m).

Note: Zeta parameters may vary significantly with changes in temperature, air pressure, humidity, visibility conditions, etc.

2.5.1.3 Other Fuels

The detector reacts to other types of fire as follows:

- The baseline fire refers to n-heptane 1ft²/0.1m² and is defined as 100% sensitivity.
- For fuel fire – standard pan fire size: 1ft²/0.1m².
- For gas flame – 30”/0.75m high, 10”/0.25m width plume fire.
- Maximum response time: 2 sec for 1x1ft n-heptane fire at 131ft/40m
- 10 sec for 1x1ft n-heptane fire at 300ft/90m

**Table 3: Fuel Sensitivity Ranges**

2.5.5 Output Signals

Outputs are available according to the default configuration or the wiring options selected for the 40/401 detector. Determine the outputs for your model according to Table 7.

The detector incorporates several types of output suitable to different control systems:

- 0–20mA (stepped) with HART
- Relays (alarm, fault, auxiliary)
- RS-485 Modbus
- Analog Output: analog output proved ultra-fast, complying with 50msec detection
### Table 7: Available Output Types

<td>0mA</td>
</tr>
</tbody>
</table>

¹ The alarm outputs are activated while alarm conditions exist and will stop approximately 5 seconds after the fire is no longer detected.
² The alarm state can be optionally latched via programmed function (default is non-latched).
³ The detector will remain in BIT Fault state until it has passed a successful BIT.
⁴ The auxiliary relay can be activated at the warning level or alarm level, depending on programmed function.

Note:
The outputs depend on the wiring options.

2.5.6.1 Optional Latching

Alarms are set as non-latching by default. However, the detector includes a latched alarm output capability, which operates according to the programmed function.

If selected, upon detection of a fire, the detection signal is latched until a manual reset is performed (disconnecting the power supply or performing a manual BIT (see Manual BIT on page 31).

Latching affects the alarm relay, 0–20mA output, the alarm LED (the auxiliary relay will be latched only when the programmable function auxiliary relay is set to Yes.

2.5.7 Auxiliary Relay as End-of-Line

The auxiliary relay can be used as End-of-Line in models with suffix – 4XXXX and 5XXXX only. In this case, the auxiliary relay is active as long as the detector is powered.
2.6 Internal Detector Tests

The detector performs 2 types of self-tests:
- Continuous Feature Test, page 29
- Built-In-Test (BIT), page 29

2.6.1 Continuous Feature Test

During normal operation, the detector tests itself continuously and indicates a fault if a failure is found. This type of test complies with SIL-2 requirements.

The detector continuously tests:
- Input voltage level
- All internal regulator voltage levels
- Voltage level status of sensor and sensor circuitry for noise or disconnection in the electronic circuitry
- 0–20mA level output
- Relays and heater operation
- Processor watchdog
- Software
- Memory
- Oscillator frequency

2.6.2 Response to Fault Indication

If a failure is found, the detector indicates by:

- Fault relay:
  - Opens in wiring options 1, 2, and 4
  - Closes in wiring options 3 and 5
- 0-20mA: indicates fault (0mA or 2mA) in wiring options 1, 2, and 3
- LED – yellow flashes (4Hz)
- Correcting the fault

The fault indications remain until the detector’s power is removed. The fault indications return if the fault is still found when power is restored.

2.6.3 Built-In-Test (BIT)

The detector’s Built-In-Test (BIT) also checks the following:
- Electronic circuitry
- Sensors
- Window cleanliness
The detector can be set to perform the BIT in the following modes:
- Automatically and manually
- Manually only

**Note:**
In a manual BIT, the outputs may also be tested and control system “inhibit” should be applied if this could initiate other systems.

### 2.6.3.1 How the BIT Operates
- The detector’s status remains unchanged if the result of a BIT is the same as the current status (normal or BIT fault).
- The detector’s status changes (from normal to BIT fault or vice versa) if the BIT differs from the current status.

**Note:**
In BIT fault status the detector can continue to detect a fire.

### 2.6.3.2 Automatic BIT
The detector automatically performs a BIT every 15 minutes. A successful BIT sequence does not activate any indicator.

All outputs of BIT results function as described in Table 10 and Table 11, and the BIT is automatically executed every 1 minute.

This sequence continues until a successful BIT occurs, when the detector resumes normal operation.

**Table 10: Results of a Successful BIT**

<table>
<thead>
<tr>
<th>Output</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

2.6.3.3 Manual BIT

The BIT is manually initiated by momentarily connecting Terminal 3 with Terminal 2 (or a switch across these terminals in the safe area).

The results of a successful and unsuccessful Manual BIT are listed in Table 12 and Table 13.

Table 12: Results of a Successful Manual BIT

2.6.3.4 Manual BIT Only

The BIT is initiated manually by momentarily connecting Terminal 3 with Terminal 2 (or a switch across these terminals in the safe area).
3 Installing the Detector

This chapter provides basic guidelines for installing the detector. It does not attempt to cover all of the standard practices and codes of installation. Rather, it emphasizes specific points of consideration and provides some general rules for qualified personnel. Wherever applicable, special safety precautions are stressed.

3.1 General Guidelines

To ensure optimal performance and an efficient installation, consider the following guidelines:

3.1.1 Sensitivity

To determine the level of sensitivity, consider the following:

- Size of fire at the required distance to be detected
- Type of flammable materials

3.1.2 Wiring

- The wire gauge must be designed according to the distance from the detector to the controller and the number of detectors on the same power line. See Wiring Instructions on page 63.
- To fully comply with EMC directive and protect against interference caused by RFI and EMI, the cable to the detector must be shielded and the detector must be grounded. The shield should be grounded at the detector end.

3.1.3 Spacing and Location

The number of detectors and their locations in the protected area are determined by:

- Size of the protected area
- Sensitivity of the detectors
- Obstructed lines of sight
- Cone of view of the detectors

3.1.4 Environment

- Dust, snow, or rain can reduce the detector’s sensitivity and require more maintenance activities.
- The presence of high intensity flickering IR sources may affect sensitivity.
3.1.5 Aiming the Detector

- The detector should be aimed toward the center of the detection zone and have a completely unobstructed view of the protected area.
- Whenever possible, the detector face should be tilted down at a 45° angle to maximize coverage and prevent accumulation of dust and dirt.
- Do not start an installation unless all conceivable considerations regarding detection location have been taken into account.

Installation should comply with NFPA 72E or any other local and international regulations and standards, as applicable to flame detectors and installation of Ex approved products.

3.2 Unpacking the Product

Upon receipt of your detector, verify that you have received the following contents:

- Delivery form
- Flame detector
- Plastic weather cover
- User manual
- Quality document
- Tool keys (per shipment)

Check and record the following:

- Verify the appropriate Purchase Order.
- Record the Part Number (P/N) and serial number of the detectors, and the installation date in an appropriate log book.
- Verify that all components required for the detector installation are readily available before beginning the installation. If the installation is not completed in a single session, secure and seal the detectors and conduits/cable entries.

3.2.1 Checking the Product Type

Check that your product has the configuration/options that you ordered. Check the detailed part number on the label and compare this information with the descriptions contained in Model and Types on page 16.

3.3 Required Tools

The detector can be installed using general-purpose common tools and equipment. Table 14 lists the specific tools required to install the detector.
Table 14: Tools

<table>
<thead>
<tr>
<th>Tool</th>
<th>Function</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hex key 3/16&quot;</td>
<td>Open and close detector cover (for wiring)</td>
<td>Part of the kit</td>
</tr>
<tr>
<td>Hex key 1/4&quot;</td>
<td>Mount the detector on the tilt mount</td>
<td>Part of the kit</td>
</tr>
<tr>
<td>Flat screwdriver</td>
<td>Connect ground terminal</td>
<td>Standard tool</td>
</tr>
<tr>
<td>6mm</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Flat screwdriver</td>
<td>Connect wires to the terminal blocks</td>
<td>Standard tool</td>
</tr>
<tr>
<td>2.5mm</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For wiring, use color-coded conductors or suitable wire markings or labels. 12–20AWG / 0.5–3.5mm² wires may be used for site wiring. The selection of wire gauge should be based on the number of detectors used on the same line and the distance from the control unit, in compliance with specifications (see General Instructions for Electrical Wiring on page 63).

3.4 Certification Instructions

Warning:
Do not open the detector, even when isolated, in the presence of any open flame.

3.4.1 Special Instructions for Safe Use

The dimensions of the flame paths are other than the relevant minimum or maximum, as required by Table 2 of EN 60079-1:2014, as detailed below:

<table>
<thead>
<tr>
<th>Flame Path Location</th>
<th>Type of Joint</th>
<th>Maximum Gap, ic</th>
<th>Minimum Length, L</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sapphire window</td>
<td>Flanged</td>
<td>0.04mm</td>
<td>10.5mm</td>
</tr>
<tr>
<td>Main spigot</td>
<td>Cylindrical</td>
<td>0.15mm</td>
<td>15.5mm</td>
</tr>
</tbody>
</table>

- Gaps, ic, should not be modified to be any larger, and lengths, L, should not be modified to be any shorter than the values shown in the table above.
- Units may be painted or fitted with optional accessories, some of which are made of a non-metallic material or have a non-metallic coating which could potentially generate an ignition-capable level of electrostatic charge under certain extreme conditions. Therefore, these units should not be installed in a location where they may be subjected to external conditions (such as high-pressure steam) which might cause a build-up of electrostatic charges on the non-conducting surfaces. Cleaning of the equipment (except window) should be done only with a damp cloth.
• The 3 fastening screws used to screw on the cover of the flameproof compartment have a yield stress of 344N/mm². Any replacement fasteners must have a yield stress of at least this value.

• When the duct mount is fitted and the equipment is intended to be mounted to a heated/cooled air duct/process vessel, it should be verified that the temperature of the air duct/process vessel should not be capable of heating or cooling any part of the equipment enclosure to a temperature outside the marked maximum ambient temperature range prior to switching the equipment on, when taking into account surrounding ambient temperature.

3.4.2 General Instructions

• The cable entry point may exceed 167°F/75°C. Suitable precautions should be taken when selecting the cable.

• The equipment may be used with flammable gases and vapors with apparatus groups IIA, IIB, and IIC:
  • T4 in the ambient temperature range: −67°F/−55°C to +167°F/+75°C.
  • T4 in the ambient temperature range: −67°F/−55°C to +185°F/+85°C.

• Installation should be carried out by suitably trained personnel in accordance with the applicable code of practice such as EN 60079-14:1997.

• Inspection and maintenance of this equipment should be carried out by suitably trained personnel in accordance with the applicable code of practice such as EN 60079-17.

• Repair of this equipment should be carried out by suitably trained personnel in accordance with the applicable code of practice such as EN 60079-19.

• The certification of this equipment relies upon the following materials used in its construction:
  • Enclosure: 316L Stainless steel or aluminum
  • Window: Sapphire glass

• If the equipment is likely to come into contact with aggressive substances, then it is the responsibility of the user to take suitable precautions that prevent it from being adversely affected, thus ensuring that the type of protection provided by the equipment is not compromised:
  • Aggressive substances: acidic liquids or gases that may attack metals, or solvents that may affect polymeric materials.
  • Suitable precautions: regular checks as part of routine inspections or establishing from the material’s data sheets that it is resistant to specific chemicals.

3.5 Installation Cables

Follow this guideline for the cable installation:

• All cables to the detector must be well shielded in order to comply with EMC requirement (see Electromagnetic Compatibility (EMC) on page 61).
- Ground the detector to the nearest ground point (not more than 3m from the detector location).
- Install the detector with the cable entries placed downwards.

### 3.5.1 Conduit Installation

The conduit used for the cabling must comply with the following:

- To avoid water condensation or water in the detector, install the detector with the conduits placed downward to include drain holes.
- When using the optional tilt mount, use flexible conduits for the last portion connecting to the detector.
- For installations in atmospheres as defined in group B of the NFPA 72E, seal the conduits’ inlets.
- When pulling the cables through the conduits, ensure that they are not tangled or stressed. Extend the cables about 30cm/12” beyond the detector location to accommodate wiring after installation.
- After the conductor cables have been pulled through the conduits, perform a continuity test.
3.6 Installing the Tilt Mount

The tilt mount (P/N 40/40-001) enables the detector to be rotated up to 60° in all directions.

Figure 4 shows the detector mounted on the tilt mount.

Figure 4: Detector with Tilt Mount
3.6.1 **Tilt Mount Assembly**

Figure 5 shows the tilt mount assembly.

![Tilt Mount Assembly](image)

**Figure 5: Tilt Mount Assembly**

Figure 6 shows the tilt mount assembly with dimensions in both millimeters and inches.

![Tilt Mount Assembly Dimensions](image)

**Figure 6: Tilt Mount Assembly (dimensions in millimeters and inches)**
To install the tilt mount and detector:

1. Place the tilt mount in its designated location and secure it with 4 fasteners through 4 holes 7mm in diameter. Use the 4 screws and spring washers according to the kit.

Note:
Removing the detector for maintenance purpose does not require the tilt mount to be removed.

2. Unpack the detector.

3. Place the detector with its conduit/cable entries pointing downwards on the holding plate of the tilt mount. Secure the detector with 5/16" 18 UNC x 1” screw to the tilt mount.

4. Release the horizontal and vertical locking screws using 3/16” Hex Key so that the detector can be rotated. Point the detector towards the protected area and make certain that the view of the area is unobstructed. Secure the detector in that position by tightening the locking screws on the tilt mount, making sure the detector is in the correct position.

   The detector is now correctly located, aligned, and ready to be connected to the system.

3.7 Connecting the Detector

This section describes how to connect the electric cabling to the detector (Figure 7).

To connect the detector to the electrical cables:

1. Disconnect the power.

2. Remove the back cover of the detector by removing 4 socket head-screws in the cover bolts. The terminal chamber is now revealed.

3. Remove the protective plug mounted on the detector conduit/cable entry; pull the wires through the detector inlet.

4. Use a ¾” – 14 NPT explosion-proof conduit connection or M25x1.5 flameproof gland to assemble the cable/conduit to the detector.
Figure 7: Detector with Cover Removed

1. Connect the wires to the required terminals on the terminal board according to the wiring diagram (Figure 7) and Table 15.

2. Connect the grounding (earth) wire to the ground (earth) screw outside the detector (earth terminal). The detector must be well grounded to earth ground.

3. Verify the wiring.

**Warning:** Improper wiring may damage the detector.

4. Check the wires for secure mechanical connection and press them neatly against the terminal to prevent them from interfering while closing the back cover (Figure 7).

5. Place and secure the detector’s back cover by screwing the 3 socket-head-screws in the cover bolts (Figure 4).
3.7.1 Verifying the Detector Wiring

The detector has 5 output wiring options within the Exde integral terminal section of the enclosure. There are 12 terminals labeled 1–12.

- For more information on the wiring options, see Wiring Instructions on page 63.
- For mA wiring options see Figure 10, Figure 11, Figure 12, and Figure 13.
- For relay connection options see Figure 9.

Table 15 describes the function of each terminal for all the wiring options.

Table 15: Model 40/40UFL Wiring Options

* Available with the HART protocol.

Notes:
- RS-485 is used for the communication network as specified in Appendix C: (Terminals 10, 11, and 12) and to connect (in a safe area) to a PC or laptop for configuration and diagnostics.
- Alarm relay:
  - N.O. contact in wiring options 1, 4, and 5.
  - N.O. and N.C. in wiring options 2 and 3.
3.8 Configuring Your Detector

You can reprogram the function setup using the RS-485 connection or the HART protocol as follows:

- **USB RS-485 Harness Kit** (P/N 794079): The USB RS-485 Harness Kit with RS-485/USB converter, used with the SPECTREX host software, enables you to connect to any available PC or laptop to re-configure settings or perform diagnostics on all 40/40 series flame detectors.

  Refer to Manual TM777050 for programming instructions when using the USB RS-485 Harness Kit.

- **HART Protocol**: Refer to Manual TM777030 for programming instructions.

These functions enable you to set:

- Sensitivity
- Alarm delay
- Address setup
- Mode of operation
- Heated optics operation

The factory default settings listed for each function include:

- Sensitivity – 40
- Alarm Delay – 0
- Alarm Latch – No
- Automatic BIT – Yes
- Auxiliary Relay – No
- EOL – No
- Heated Optics – Auto
- Temperature – 41°F/5°C
3.8.1 Sensitivity

The detector offers 4 sensitivity settings. The settings refer to an n-heptane or gasoline fire of 1ft²/0.1m², from low sensitivity of 50ft/15m to 215ft/65m. For other types of fuel sensitivity, refer to Table 3.

### Table 16: Sensitivity Settings

<td>65</td>
</tr>
</tbody>
</table>

3.8.2 Alarm Delay

The detector is equipped with an alarm delay option, which provides programmable time delays with settings at:

- Anti-flare (default)

#### Note:

The anti-flare mode is selected to prevent false alarms in locations where fast flares may be present. The time delay for fire alarms in this mode ranges from 2.5–15 seconds, and is usually less than 10 seconds.

- 0, 3, 5, 10, 15, 20, or 30 seconds

When an alarm (detection) level condition occurs, the detector delays the execution of the alarm outputs by the specified period of time. The detector then evaluates the condition for 3 seconds. If the alarm level is still present, the alarm outputs are activated. If this condition no longer exists, the detector returns to its standby state.

The alarm delay option affects the output relays and the 0–20mA. The LEDs and outputs indicate warning levels during the delay time only if the fire condition exists.

3.8.3 Address Setup

The detector provides up to 247 addresses that can be changed with the RS-485 communication link or the HART protocol.

3.8.4 Function Setup

You can select the desired functions as detailed in Table 17.
Table 17: Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Setting</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td></td>
<td>• <strong>No</strong>: Auxiliary Relay operates in accordance with Functions 2 and 5 (default).</td>
</tr>
</tbody>
</table>

* Only available in Models 40/40I-4XXXX and 5XXXX

3.8.5 Heated Optics

The heated optics can be defined as one of the following modes:

- Heated Mode
  - **Off**: Not operated
  - **On**: Continuously
  - **Auto**: Per temperature change

In Auto mode, the default Heat On setting is 41°F/5°C. Heating stops when the temperature is 27°F/15°C above the start temperature.

You can define the start temperature below which the window will be heated. The temperature can be defined between 32–86°F / 0–30°C.
4 Operating the Detector

This chapter describes how to power up and test the detector. It also includes some very important safety checks that you should complete before operating the detector.

4.1 Powering Up

This section describes how to turn on the detector. Follow these instructions carefully to obtain optimal performance from the detector over its life cycle:

To power up the detector:

1. Turn on the detector.
2. Wait up to 60 seconds for the detector to finish the start-up procedure.
   Turning on the detector initiates the following sequence of events:
   - The yellow LED flashes at 4Hz.
   - BIT is executed.
   - If successful, the green LED flashes at 1Hz, the fault relay contacts close, and mA output is 4mA.
3. Enter Normal mode.

Caution: The majority of detectors are used in the default non-latched alarm mode. Only perform a reset when the latched alarm option has been programmed.

To reset the detector when it is in a latched alarm state:

- Disconnect power (Terminal 1 or Terminal 2).
- Or
- Initiate a manual BIT.

4.2 Safety Precautions

After powering up, the detector requires almost no attention in order to function properly, but the following should be noted:

- Follow the instructions in this guide and refer to the drawings and specifications.
- Do not expose the detector to radiation of any kind unless required for testing purposes.
- Do not open the detector housing while power is connected.
• Do not open the electronic compartment. This part should be kept closed at all times and only opened in the factory. Opening the electronic component side invalidates the warranty.

• You should only access the wiring compartment to wire or remove the detector, or to access RS-485 terminals for maintenance.

• External devices such as automatic extinguishing systems must be disconnected or disabled before carrying out any maintenance.

4.2.1 Default Functions Settings

Table 18 lists the default function configuration supplied with the detector.

**Table 18: Default Function Values**

<table>
<thead>
<tr>
<th>Function</th>
<th>Value</th>
<th>Notes</th>
</tr>
</thead>
<tbody>

<td>Auto</td>
<td></td>
</tr>
<tr>
<td>Heat On</td>
<td>41°F/5°C</td>
<td>The detector starts heating the window for any temperature below this value (in degrees Celsius).</td>
</tr>
</tbody>
</table>

• In order to change the default function, use:
  • USB RS-485 Harness Kit P/N 794079. Refer to Manual TM777050 for programming instructions when using the USB RS-485 harness kit.
  • HART protocol, refer to Manual TM777030 for instructions.

4.3 Testing Procedures

This section describes the proof testing procedure for proper operation of the detector. The detector can be tested using the Manual BIT or the SPECTREX Flame Simulator FS-1100.

The detector performs internal tests continuously and automatic BIT tests every 15 minutes. For more details refer to Built-In-Test (BIT) on page 29.
4.3.1 Automatic BIT Test

Check that the indicators show normal conditions. See Powering Up on page 47.

4.3.2 Manual BIT Test

Caution:
If the function setup alarm BIT and/or auxiliary BIT are set to Yes (default is No), the alarm, auxiliary relay, and 0–20mA outputs are activated during a Manual BIT. Therefore, automatic extinguishing systems or any external devices that may be activated during BIT must be disconnected.

To perform a manual BIT:
1. Verify that the detector is in Normal Mode.
2. Initiate manual BIT. The results of successful and unsuccessful manual BITs are detailed in Table 12 and Table 13.

4.3.3 Testing with Flame Simulator Model FS-1100

The Flame Simulator Model FS-1100 can be used to simulate exposure of the detector to a real fire condition. The detector is exposed to radiation at the required detection level. As a result, the detector will generate a Fire Alarm signal. See Flame Simulator FS-1100 on page 55 for more information.

Caution:
If the detector is exposed to a flame simulator, the alarm and accessory relays and 0–20mA are activated during the simulation. Therefore, automatic extinguishing systems and any external devices which may be activated during this process must be disconnected.

To perform a flame simulator test:
1. Power up the system and wait up to 60 seconds for the detector to turn to a normal state. The Power LED turns on.
2. Aim the SPECTREX Flame Simulator Model FS-1100 at the target point of the detector (Figure 14), such that the radiation emitted by it is facing directly towards the detector. (See Flame Simulator FS-1100 on page 71).
3. Press the operation button once. After few seconds, a successful test shows the results listed in Table 19.

The detector is now ready for operation.

5 Maintenance and Troubleshooting

This chapter deals with preventive maintenance, describes possible faults in detector operation and indicates corrective measures. Ignoring these instructions may cause problems with the detector and may invalidate the warranty. Whenever a unit requires service, please contact SPECTREX or its authorized distributor for assistance.

5.1 Maintenance

This section describes the basic maintenance steps that should be taken to keep the detector in good working condition.

5.1.1 General Procedures

Maintenance should be performed by suitably qualified personnel, who are familiar with local codes and practice. Maintenance requires ordinary tools.

5.1.1.1 Cleaning

The detector must be kept as clean as possible. Clean the viewing window and the reflector of the flame detector periodically.

The frequency of cleaning operations depends upon the local environmental conditions and specific applications. The fire detection system designer will give his recommendations.

To clean the detector viewing window and reflector:

1. Disconnect power to the detector before proceeding with any maintenance including window/lens cleaning.

2. Use water and detergent, and then rinse the viewing window with clean water.

3. Where dust, dirt, or moisture accumulates on the window, first clean with a soft optical cloth and detergent only, and then rinse with clean water.

5.1.2 Periodic Procedures

In addition to preventive cleaning and maintenance, the detector should be functionally tested every 6 months or as dictated by local codes and regulations. These tests should also be conducted if the detector has been opened for any reason.

5.1.2.1 Power-Up Procedure

Perform the power-up procedure every time power is restored to the system. Follow the instructions described in Powering Up on page 47.
5.1.2.2 Functional Test Procedure

Perform a functional test of the detector as described in *Internal Detector Tests* on page 29.

5.1.3 Keeping Maintenance Records

Maintenance operations performed on a detector should be recorded in a log book. The record should include the following:

- Installation date
- Contractor
- Serial and tag number
- Entries for every maintenance operation performed, including a description of the operation, date, and personnel ID

If a unit is sent to SPECTREX or a distributor for service, a copy of the maintenance records should accompany it.
5.2 Troubleshooting

This section is a guide to correct problems which may happen during normal operation.

### A.2.1 Electrical Input Protection

The input circuit is protected against voltage-reversed polarity, voltage transients, surges, and spikes according to MIL-STD-1275B.

### A.3 Outputs

#### A.3.1 Electrical Interface

There are 5 output wiring options. These options are defined at the factory per the customer order and cannot be changed at the customer facility.

See General Instructions for Electrical Wiring on page 63 for the wiring/terminal diagram for each option.

Unless otherwise specified, the default is option 1. The wiring arrangement is identified on the detector by the part number (see Model and Types on page 16).

- **Option 1**: Power, RS-485, Analog Output 0–20mA (Sink), Fault I Relay (N.C.), Alarm Relay, (N.O.) (see Figure 7).
- **Option 2**: Power, RS-485, Analog Output 0–20mA (Source) and HART protocol, Fault Relay (N.O.), Alarm Relay, (N.O.), (N.C.).
- **Option 3**: Power, RS-485, Analog Output 0–20mA (Source) and HART protocol, Fault Relay (N.O.), Alarm Relay (N.O., N.C.).

### A.3.2 Electrical Outputs

#### A.3.2.1 Dry Contact Relays

</tbody>
</table>

\(^5\) The fault relay (in wiring options 1, 2, and 4) is normally energized closed during normal operation of the detector. The relay is de-energized open in a fault condition or low voltage situation.

\(^6\) In wiring options 3 and 5 the relay is normally energized open during normal operation of the detector. The relay is de-energized close contact in a fault condition or low voltage situation.

#### A.3.2.2 0–20mA Current Output

The 0–20mA can be sink or source according to the wiring option source (see *General Instructions for Electrical Wiring* on page 63). The maximum permitted load resistance is 600Ω.

**Table 23: 20mA Current Output**

#### A.3.2.3 HART Protocol

The HART protocol is a digital communication signal at a low level on top of the 0–20mA. This bi-directional field communication protocol is used to communicate between intelligent field instruments and the host system. HART is available in wiring options 2 and 3.
Specifications

Through the HART protocol the detector can:

- Display setup
- Reconfigure setup
- Display detector status and definition
- Perform detector diagnostics
- Troubleshoot

For more details refer to *HART Manual TM777030*.

A.3.2.4 **Communication Network:**

The detector is equipped with an RS-485 communication link that can be used in installations with computerized controllers.

- The communications protocol is Modbus compatible.
- This protocol is a standard and widely used.
- It enables continuous communication between a standard Modbus controller (Master device) and a serial Network of up to 247 detectors.

A.3.3 **Heated Optics**

The front window can be heated to improve performance in ice, condensation, and snow conditions. The heater increases the temperature of the optical surface by 5–8°F / 3–5°C above the ambient temperature. The heated optics can be configured in 3 ways:

- **Off:** The optics are not heated
- **On:** The optics are heated continuously
- **Auto:** Operated only when the change of temperature requires the heating (default)

In auto mode the start heating temperature can be defined between 32–86°F / 0–30°C. The detector stops heating the window when the temperature is 27°F/15°C above the start temperature.

A.6 Environmental Specifications
The SharpEye 40/40I is designed to withstand harsh environmental conditions.

A.6.1 High Temperature
- Designed to meet MIL-STD-810C, Method 501.1 Procedure II
- Operating temperature: +167°F/+75 °C
- Storage temperature: +185 °F/+85 °C

A.6.2 Low Temperature
- Designed to meet MIL-STD-810C, Method 502.1, Procedure I
- Operating temperature: −57°F/−50°C
- Storage temperature: −65°F/−55°C

A.6.3 Humidity
- Designed to meet MIL-STD-810C, Method 507.1, Procedure IV
- Relative humidity of up to 95% for the operational temperature range

A.6.4 Salt Fog
- Designed to meet MIL-STD-810C, Method 509.1, Procedure I
- Exposure to a 5% salt solution fog for 48 hours
A.6.5 Dust

- Designed to meet MIL-STD-810C, Method 510.1, Procedure I
- Exposure to a dust concentration of 0.3g/ft² at a velocity of 1750fpm, for 12 hours

A.6.6 Vibration

- Designed to meet MIL-STD-810C, Method 514.2, Procedure VIII
- Vibration at an acceleration of 1.1g within the frequency range of 5–30Hz, and an acceleration of 3g within the frequency range of 30–500Hz

A.6.7 Mechanical Shock

- Designed to meet MIL-STD-810C, Method 516.2, Procedure I
- Mechanical Shock of 30g half-sine wave, for 11 msec

Caution:

To fully comply with EMC directive 2014/30/EU and protect against interference caused by RFI and EMI, the cable to the detector must be shielded and the detector must be grounded. The shield should be grounded at the detector end.
Appendix B: Wiring Instructions

B.1 General Instructions for Electrical Wiring

Follow the instructions detailed in this section for determining the correct wire gauge to be used for the installation.

1 Use Table 25 to determine the required wire gauge /size for general wiring, such as relay wiring. Calculate the permitted voltage drop with respect to load current, wire gauge, and length of wires.

Table 25: Maximum DC Resistance at 68°F/20°C for Copper Wire

<td>0.27</td>
<td>0.88</td>
</tr>
</tbody>
</table>

2 Use Table 26 to select wire gauge for power supply wires. DO NOT connect any circuit or load to detectors’ supply inputs.

- Select number of detectors connected in 1 circuit.
- Select wiring length per your installation requirements.
- Refer to power supply range for voltage extreme applied.

<td>Max. Length from Power Supply to Last Detector</td>
</tr>
</tbody>
</table>

B.2 Calculation Formula
Use the following formula to calculate minimum wire gauge per wire length between the power supply (controller) and the detector, considering the number of detectors on the same power line, where:

- \( L \) = Actual wire length between the detector and the power supply
- \( N \) = Number of detectors per loop
- \( R \) = Resistance of wire per 100m (see Table 25)
- \( V \) = Voltage drop on the wire

**Calculate the voltage drop on the wire as follows:**

\[
V = \frac{2L \times R \times N \times 0.2A}{100}
\]

- \( 20 + V \) = Minimum required voltage of the power supply
- \( 0.2A \) is the maximum power consumption of the detector

For example, if \( N=1 \) (1 detector in loop)

- \( L = 1000m \)
- Wire size = 1.5mm\(^2\) (see Table 26, the resistance per 100m for 1.5mm\(^2\) is 1.4Ω)

**Calculate the voltage drop in the wire as follows:**

\[
\frac{2 \times 1000 \times 1.4Ω \times 1 \times 0.2A}{100} = 5.6V
\]

The minimum voltage of the power supply should be \( 20V + 5.6V = 25.6V \)
B.3 Typical Wiring Configurations

This section describes examples of typical wiring configurations.

**Notes:**
- Source 3-wire available with the HART Protocol
- There are no 0–20mA outputs in wiring options 4 and 5.
Appendix C: RS-485 Communication Network

C.1 RS-485 Overview

By using the RS-485 network capability of the UV/IR detector and additional software, it is possible to connect up to 32 detectors in an addressable system with 4 wires only (2 for power and 2 for communication). Using repeaters, the number of detectors can be much larger (32 detectors for each repeater) up to 247 on the same 4 wires. When using the RS-485 network, it is possible to read each detector status (FAULT, WARNING, and ALARM) and to initiate a BIT for each detector individually.

For more details, contact SPECTREX.

Figure 14: RS-485 Networking
Appendix D: Accessories

This appendix describes the accessories that can help you maximize fire detection with the SharpEye IR3Flame Detector:

D.1 Flame Simulator FS-1100

The Flame Simulator FS-1100 is designed specifically for use with SharpEye Flame Detectors. The Flame Simulator emits IR radiation in a unique sequential pattern corresponding to and recognizable by the detector as fire, which allows the detectors to be tested under simulated fire conditions without the associated risks of an open flame.

Figure 15: Flame Simulator FS-1100

D.1.1 Ordering Information

The P/N of the Flame Simulator Kit is 380114-1.

The kit is supplied in a carry case that includes:

- Flame Simulator FS-1100
- Charger
- Tool Kit
- Technical Manual TM380002
D.1.2 Unpacking

Verify that you have received the following contents:

- Delivery form
- Flame simulator with integral battery
- Battery charger
- Tool keys
- User manual
- FAT forms
- EU declaration
- Storage case

D.1.3 Operating Instructions

---

**Warning:**

Do not open the flame simulator to charge the batteries or for any other reason in a hazardous area.

---

**Caution:**

The following test simulates a real fire condition and may activate the extinguishing system or other alarms. If activation is not desired, disconnect/inhibit them before the test and reconnect after the simulation.

---

**To simulate a fire:**

1. Verify you are at the correct distance from the detector according to the type of detector and the detector sensitivity.
2. Using the mechanical sight, aim the flame simulator toward the center of the detector.
3. Push the activate button, and then use the laser spot for fine adjustment toward the center of the detector.
4. Keep the simulator aimed at the detector for up to 50 seconds, until you trigger an alarm.
5. Wait 20 seconds before repeating the test.
D.1.4 Range

**Table 28: Sensitivity Ranges**

<table>
<thead>
<tr>
<th>Sensitivity</th>
<th>Detection Range (ft/m)</th>
<th>Standard Test Range (ft/m)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 (Low)</td>
<td>50/15</td>
<td>6.6/2</td>
</tr>
<tr>
<td>2</td>
<td>100/30</td>
<td>19.6/6</td>
</tr>
<tr>
<td>3</td>
<td>150/45</td>
<td>29.5/9</td>
</tr>
<tr>
<td>4 (High)</td>
<td>215/65</td>
<td>39.3/12</td>
</tr>
</tbody>
</table>

**Notes:**
- The minimum distance from the detector is 30”/75cm.
- At extreme temperatures, there is a 15% maximum reduction in the range.

**Warning:**
Keep the flame simulator in a safe place when not in use.

D.1.5 Charging the Battery

The flame simulator uses lithium-ion batteries as a rechargeable power source. When the batteries are fully charged, the simulator operates at least 1,000 times without having to be recharged. The simulator will not operate when the voltage from the batteries is lower than the required operational level.

![Figure 16: Flame Simulator Battery Replacement](image)

<td>Back Cover</td>
</tr>
</tbody>
</table>

![Figure 16: Flame Simulator Battery Replacement](image)
To charge the battery:

**Caution:**
Place the flame simulator on a table in a safe area, not exceeding 104°F/40°C.

1. Release the locking screw.
2. Unscrew the battery back cover (Item 4) counterclockwise.
3. Unscrew the locking disc (Item 3) clockwise.
4. Pull out the battery from the flame simulator.
5. Connect the battery to the charger.
6. Charge for a maximum of 2–3 hours.
7. Disconnect the charger.
8. Insert the battery into the Flame Simulator.
9. Screw on the locking disc (Item 3).
10. Screw on the back cover (Item 4).
11. Lock the back cover with the locking screw.

**D.1.6 Battery Replacement**

To replace the battery:

1. Place the flame simulator on a table in a safe area, not exceeding 104°F/40°C.
2. Release the locking screw.
3. Unscrew the battery back cover (Item 4) counterclockwise.
4. Unscrew the locking disc (Item 3) clockwise.
5. Pull out the battery from the flame simulator.
6. Insert the new battery pack in the simulator housing. Use only SPECTREX battery pack, P/N 380004.
7. Screw on the locking disc (Item 3).
8. Screw on the back cover (Item 4).
9. Lock the back cover with the locking screw.

**Note:**
For more information refer to TM380002.
D.2 Technical Specifications

D.2.1 General

- **Temperature Range**: –4°F to +122°F / –20°C to +50°C
- **Vibration Protection**: 1g (10–50Hz)

D.2.2 Electrical

- **Power**: 14.8V (4 x 3.7V rechargeable lithium-ion battery)
- **Max. Current**: 4A
- **Battery Capacity**: 2.2AH
- **Charging Time**: 2A at 2hr

D.3 Tilt Mount

The tilt mount (P/N 40/40-001) provides accurate directional selection for optimum area coverage.

Figure 17: Tilt Mount
D.4 Duct Mount

The duct mount (P/N 777670) is suitable for use with the SharpEye 40/40 Series Optical Flame Detector 40/40I, for both the aluminum and st.st. enclosure.

The duct mount allows flame detection in areas where high temperatures exist or where the detector cannot be installed inside the area. It comprises a special duct mount arrangement with a specific optical window to allow installation in high temperature duct applications.

The duct mount limits the cone of vision of the installed detector to 65° horizontal and 65° vertical.

The temperature allowed for the duct mount to be installed is: 

\[-55^\circ \text{C} \text{ to } +200^\circ \text{C} / -67^\circ \text{F} \text{ to } +392^\circ \text{F}\]

For more instructions refer to TM777670.

![Figure 18: Duct Mount](image)
D.5 Weather Cover

The weather cover (P/N 777163) protects the detector from different weather conditions, such as snow and rain.

Figure 19: Weather Cover
D.6 Air Shield

The air shield (P/N 777650) is suitable for use with the SharpEye 40/40 Series Optical Flame Detector 40/40I, for both the aluminum and st.st. enclosures.

Optical flame detectors are often used in highly polluted or dirty areas that force maintenance personnel to access the detector frequently in order to clean its optical window. The special air shield, developed for SharpEye 40/40 series optical flame detectors, allows their installation under environmental conditions where they may be exposed to oil vapors, sand, dust, and other particulate matter.

The temperature of the air supply to the air shield should not exceed 60°C/140°F at any time.

- **Air pressure source**: Clean, dry, and oil-free air
- **Pressure**: 2–3 bar / 30–45 psi
- **Fitting**: 7/16” – 20UNF-2A
- **Operation temperature**: -55°C to +85°C / -67°F to +185°F

For more instructions, refer to **TM777650**.

![Figure 20: Air Shield](image)
Appendix E: SIL-2 Features

E.1 40/40I Flame Detector

This appendix details the special conditions for compliance with the requirements of EN 61508 for SIL 2.

The 40/40I Flame Detector can only be used in low or high demand mode applications. See IEC 61508.4, Chapter 3.5.12.

E.1.1 Safety Relevant Parameters

Perform the following functional checks of the detector:

E.1.1.1 Alternative 1: Functional check of the detector every 180 days

- **Alternative 1**: Functional check of the detector every 180 days:
  - **HFT**: 0
  - **PFD**: 3.1 x 10^-4 (≈ 3% of SIL-2) if only alarm relay is used for alerting
  - **PFD**: 3.3 x 10^-4 (≈ 3.2% of SIL-2) if 0–20mA interface is used as alarm
  - **PFH**: 1.5 x 10^-7 1/h (≈ 14.9% of SIL-2) for 0–20mA application
  - **SFF**: 95% fulfills the conditions of EN 61508 for SIL2

- **Alternative 2**: Functional check of the detector every 365 days:
  - **HFT**: 0
  - **PFD**: 4.6 x 10^-4 (≈ 4.5% of SIL-2) if only alarm relay is used for alerting
  - **PFD**: 5.0 x 10^-4 (≈ 4.9% of SIL-2) if 0–20mA interface is used for signal current as alarm
  - **PFH**: 1.5 x 10^-7 1/h (≈ 14.9% of SIL-2) for 0–20mA application
  - **SFF**: 95% fulfills the conditions of EN 61508 for SIL2

E.1.2 Guidelines for Configuring, Installing, Operating, and Service

The alert conditions according to SIL 2 can be implemented by an:

- Alert signal via 20mA current loop
- Or
- Alert signal via alarm relay and the fault relay
E.1.2.1 Conditions for Safe Operating

- The flame detector must consist only of the approved hardware and software modules.
- The 24V power supply must fulfill the requirements for PELV/SELV of EN 60950.
- The automatic BIT (Built-In-Test) must be activated.
- The setup parameters must be verified (as described in Using the 0–20mA Interface for Alerting on page 82; and Using the Alarm Relay Contact for Alerting on page 83; and Using the Alarm Relay Contact for Alerting on page 83).
- The function of the 40/40 Flame Detector (flame detection, function of the 0–20mA interface, and relay functions) must be checked completely.

E.1.2.2 Using the 0–20mA Interface for Alerting

- The following parameters should be set:
  - Automatic BIT test = on
  - Connected to 0–20mA Terminals
- The following allowed output current must be supervised with an accuracy of ± 5%:
  - Normal State = 4mA
  - Warning State = 16mA
  - Alarm State = 20mA
- The 0–20mA can be used as low and high demand mode.

Caution:
The receiving device must be programmed to indicate a fault condition when current levels reach overcurrent or undervoltage.
E.1.2.3 Using the Alarm Relay Contact for Alerting

- The following parameters should be set:
  - Automatic BIT Test = on
  - Connected to N.C. contact of alarm relay terminals
  - Connected to fault relay terminals
  - The relay contacts ("alarm" and "faulty relay") must be protected with a fuse rated at 0.6 of the nominal specified relay contact current.
  - The maximum contact rating that is allowed per SIL-2 is 30VDC.
  - The contact of the alarm relay opens if there is a fire alarm.
  - During the forwarding and evaluation of the alarm, the relay contact opens.
  - The alarm relay can be used as low demand only.

E.1.2.4 Other

- The complete function of the flame detector (flame detection, function of the 0–20mA interface, the relays, and the analog output interface) must be examined at least every 6 or 12 months (see Safety Relevant Parameters on page 81), or whenever the flame detector must be switched off and on.
- The window of the sensor must be examined at appropriate time intervals for partial contamination.

Caution:
The HART and the RS-485 interfaces must not be used for the transmission of safety-related data.
The 40/40 series can be equipped with an EOL resistor inside the flameproof 'd' terminal compartment.

The EOL resistor can be situated in the rear part which is Ex e or Ex d, depending on the application. When the resistor is assembled, the rear part can be used as Ex d only.

To meet the allowed power consumption, the total resistance should be higher than 1.5KΩ.
